

	Labo Apps for iOS Dirk Hostens & Milan Dima
Opdracht 2	Website: http://developer.apple.com

In this assignment, we will create a multiplatform app about a trip to Barcelona. The app will have three tabs. The screens will look as follows, where you can scroll through the information on the info screen.

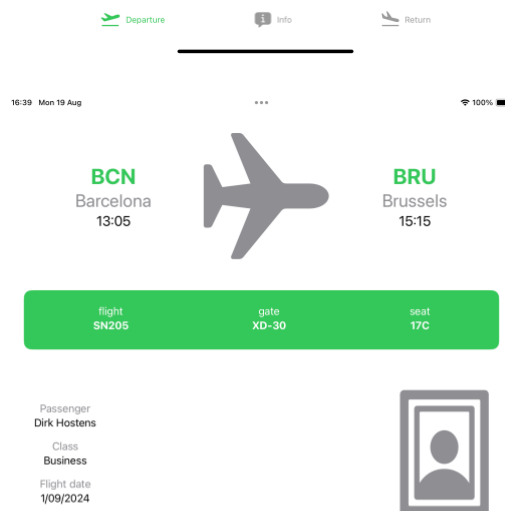

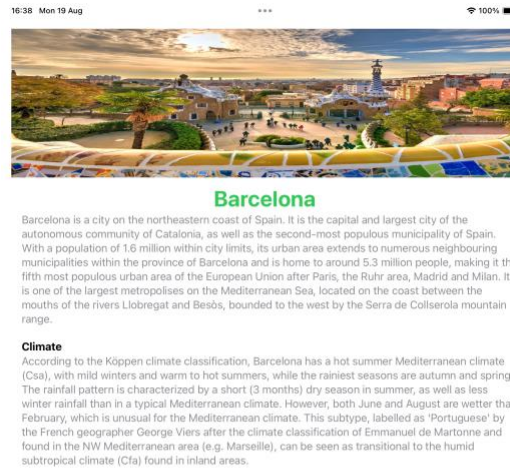

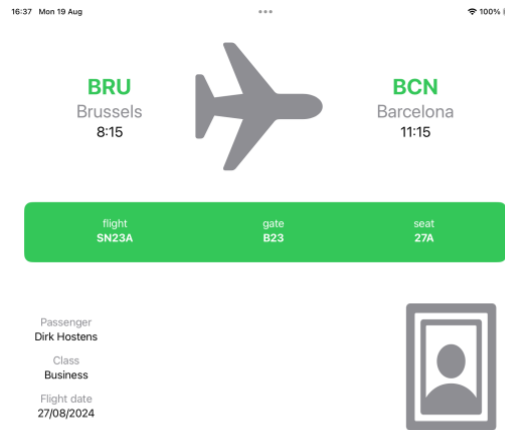

iPhone

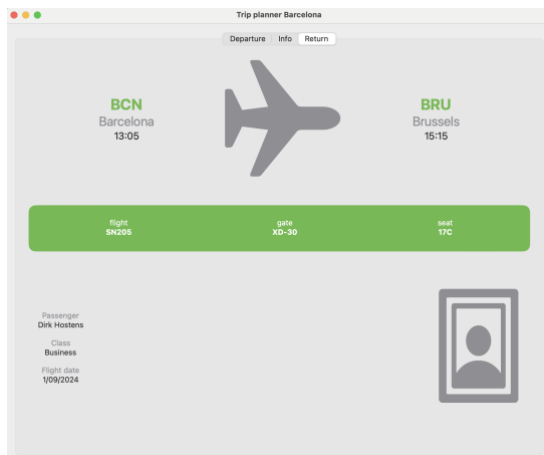

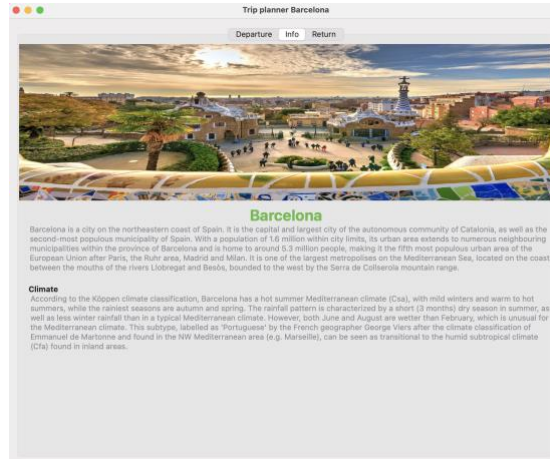

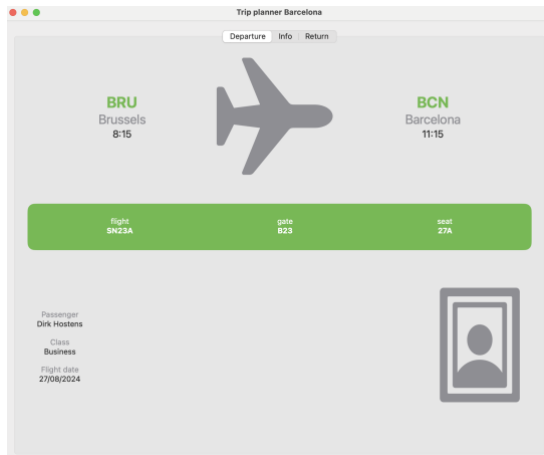

Bachelor in de Toegepaste Informatica

iPad

macOS

Additional Information:

- Each tab has a title and an associated icon (based on `systemImage`).
- As you can see, the accent color is green. You can set this in the app's Assets folder by changing the asset `AccentColor` to green. You can then use `.tint` as the color:

```
swift
CopyEdit
Text("Barcelona").foregroundColor(.tint)
```

- To configure properties on a `Text` view, right-click on `Text` in your code and select **Show SwiftUI Inspector**.
- The first and last tabs are similar. They display flight details for departure and arrival.

- First, create the screen as shown in the example with hardcoded text. Eventually, we will create a subview based on flight information. This flight information is stored in a `struct FlightInfo`.
- The size of the airplane image varies per device:

- **iPhone:** 50 x 50
- **iPad:** 200 x 200
- **macOS:** 220 x 220
- You can check the OS and device type in code as follows:

```
#if os(iOS)
if UIDevice.current.userInterfaceIdiom == .phone {
    ...
} else {
    ...
}
#else
    ...
#endif
```

- The green block containing the flight, seat, and gate information is built using a `Grid` and `GridRow`. This ensures proper text alignment. To make the `Grid` take up the full width, add a `Divider`. You can make it “invisible” by setting its color to match the background using `.overlay(.tint)`.
- Use **subviews** as much as possible for reusable views.
- The **information about Barcelona** can be copied from Wikipedia. Ensure there is enough text to properly test the `ScrollView`. The layout should match the example screen.
- The **image on the info tab** should have a height of 300. Add this image as an **Image Set** in the Assets folder.
- The **Display Name** of the app should be "Trip Planner Barcelona". Look in the app settings to find where to change this.

Documentation: HS, ESW, CVP, AM, DI

Good luck!
